## Definition

Let  $X$  and  $Y$  be Banach spaces. A twisted sum of  $Y$  and  $X$  is a short exact sequence of the form:

$$0 \longrightarrow Y \xrightarrow{T} Z \xrightarrow{S} X \longrightarrow 0,$$

where  $Z$  is a Banach space and the maps  $T$  and  $S$  are linear and bounded.

## Remark

Note that since  $T[Y] = \text{Ker}S$ , it follows from the Open Mapping Theorem that  $Y$  is isomorphic to  $T[Y]$  and the quotient  $Z/T[Y]$  is isomorphic to  $X$ , through  $\bar{S} : Z/T[Y] \rightarrow X$ .

## Example

If  $X$  and  $Y$  are Banach spaces and the direct sum  $Y \oplus X$  is endowed with some product norm, then:

$$0 \longrightarrow Y \xrightarrow{i_1} Y \oplus X \xrightarrow{\pi_2} X \longrightarrow 0$$

is a twisted sum of  $Y$  and  $X$ , where  $i_1$  is the canonical embedding and  $\pi_2$  is the second projection.

## Definition

A twisted sum:

$$0 \longrightarrow Y \xrightarrow{T} Z \xrightarrow{S} X \longrightarrow 0$$

of Banach spaces  $Y$  and  $X$  is called trivial if  $T[Y]$  is complemented in  $Z$ .

## Question

*Are there nontrivial twisted sums of Banach spaces?*

**Answer:** Yes.

## Theorem (Phillips–1940)

*The sequence space  $c_0$  is not a complemented subspace of  $\ell_\infty$ .*

## Corollary

*The twisted sum:*

$$0 \longrightarrow c_0 \xrightarrow{\text{inc}} \ell_\infty \xrightarrow{q} \ell_\infty / c_0 \longrightarrow 0,$$

*is not trivial, where  $\text{inc}$  denotes the inclusion map and  $q$  denotes the quotient map.*

## Theorem (Sobczyk–1941)

*Every isomorphic copy of  $c_0$  inside a separable Banach space is complemented.*

## Corollary

*If  $X$  is a separable Banach space, then every twisted sum of  $c_0$  and  $X$  is trivial.*

**Proof.** Let  $Z$  be a Banach space such that:

$$0 \longrightarrow c_0 \longrightarrow Z \longrightarrow X \longrightarrow 0$$

is an exact sequence. In this case  $Z$  is separable and therefore this twisted sum is trivial. □

## Definition

*Given a compact Hausdorff space  $K$ , we denote by  $C(K)$  the Banach space of continuous real-valued functions defined on  $K$ , endowed with the supremum norm.*

## Proposition

*Let  $K$  be a compact Hausdorff space. The Banach space  $C(K)$  is separable if and only if  $K$  is metrizable.*

## Corollary (Corollary of Sobczyk's Theorem)

*If  $K$  is a metrizable compact space, then every twisted sum of  $c_0$  and  $C(K)$  is trivial.*

$X$  separable  $\Rightarrow$  every twisted sum of  $c_0$  and  $X$  is trivial

### Question

*Let  $X$  be a Banach space. If every twisted sum of  $c_0$  and  $X$  is trivial, then  $X$  must be separable?*

**Answer: No.**

### Proposition

*If  $I$  is an uncountable set, then the Banach space  $\ell_1(I)$  is not separable and every twisted sum of  $c_0$  and  $\ell_1(I)$  is trivial.*

**Proof.** The space  $\ell_1(I)$  is a *projective* Banach space, i. e., if  $W$  and  $Z$  are Banach spaces and  $q : W \rightarrow Z$  is a quotient map, then every bounded operator  $T : \ell_1(I) \rightarrow Z$  admits a lifting:

$$\begin{array}{ccc}
 & & W \\
 & \nearrow & \downarrow q \\
 \ell_1(I) & \xrightarrow{T} & Z
 \end{array}$$

$$\begin{array}{ccccccc}
 & & & & \ell_1(I) & & \\
 & & & & \downarrow Id & & \\
 0 & \longrightarrow & Y & \longrightarrow & X & \xrightarrow{q} & \ell_1(I) \longrightarrow 0 \\
 & & & & \nwarrow & & \\
 & & & & \ell_1(I) & & 
 \end{array}$$

$K$  metrizable  $\Rightarrow$  every twisted sum of  $c_0$  and  $C(K)$  is trivial

Open Problem (Cabelo, Castillo, Kalton and Yost–2003)

*Is there a nonmetrizable compact Hausdorff space  $K$  such that every twisted sum of  $c_0$  and  $C(K)$  is trivial?*

This problem remains open, but we are working on it!

## Remark

*If  $K$  is a compact metric space, then  $K$  is homeomorphic to a  $\|\cdot\|$ -compact subset of a Banach space.*

## Definition

*A compact space is said an Eberlein compactum if it is homeomorphic to a weakly compact subset of a Banach space, endowed with the weak topology.*

## Example

*Every metrizable compact space is Eberlein and the one-point compactification of an uncountable discrete space is a nonmetrizable Eberlein compactum.*

## Remark

*Eberlein compacta share many properties with compact metrizable spaces. For instance: If  $K$  is an Eberlein compact space, then  $K$  is a sequential space.*

## Theorem (Cabello, Castillo, Kalton and Yost–2003)

*If  $K$  is a nonmetrizable Eberlein compact space, then there exists a nontrivial twisted sum of  $c_0$  and  $C(K)$ .*

In the same paper, the authors claimed that with similar arguments one could prove that if  $K$  is a nonmetrizable Corson compact space, then there exists a nontrivial twisted sum of  $c_0$  and  $C(K)$ . It turns out that similar arguments do not work and that the situation is much more complicated.

## Theorem (Amir and Lindenstrauss–1968)

*A compact space  $K$  is an Eberlein compactum if and only if  $K$  is homeomorphic to a weakly compact subset of the Banach space  $c_0(\Gamma)$ , for some index set  $\Gamma$ .*

## Corollary

*If  $K$  is an Eberlein compactum, then  $K$  is homeomorphic to a compact subspace of  $c_0(\Gamma)$ , endowed with the product topology.*

## Remark

*This copy of  $K$  is contained in  $\Sigma(\Gamma)$ , where:*

$$\Sigma(\Gamma) = \{x \in \mathbb{R}^\Gamma : x \text{ has countable support}\}.$$

## Definition

*A compact space is called a Corson compact space if it is homeomorphic to a subset of  $\Sigma(\Gamma)$ , endowed with the product topology, for some index set  $\Gamma$ .*

## Remark

*Every Eberlein compact space is Corson, but there are Corson compact spaces that are not Eberlein.*

## Theorem (Correa and Tausk, JFA–2016)

*Assume MA. If  $K$  is a nonmetrizable Corson compact space, then there exists a nontrivial twisted sum of  $c_0$  and  $C(K)$ .*

## Open Problem

*Does it hold in ZFC that there exists a nontrivial twisted sum of  $c_0$  and  $C(K)$ , for every nonmetrizable Corson compact space?*

## Definition

*A Compact space  $K$  is called a Valdivia compactum if there exists a continuous and injective map  $\varphi : K \rightarrow \mathbb{R}^\Gamma$  such that  $\varphi^{-1}[\Sigma(\Gamma)]$  is dense in  $K$ . In this case,  $\varphi^{-1}[\Sigma(\Gamma)]$  is called a dense  $\Sigma$ -subset of  $K$ .*

## Example

*Every Corson compact space is Valdivia. Examples of Valdivia spaces that are not Corson are given by the product spaces  $2^\kappa$ , for any uncountable  $\kappa$ .*

## Theorem (Correa and Tausk, JFA–2016)

*Assume CH. Let  $K$  be a Valdivia compact space. If  $K$  satisfies any of the following properties, then there exists a nontrivial twisted sum of  $c_0$  and  $C(K)$ :*

- $K$  has a  $G_\delta$  point with no second countable neighborhoods;
- $K$  has a dense  $\Sigma$ -subset  $A$  such that some point of  $K \setminus A$  is the limit of a nontrivial sequence in  $K$ .

## Theorem (Correa and Tausk, JFA–2016)

*There exists a nontrivial twisted sum of  $c_0$  and  $C(2^c)$ . Therefore, under CH, there exists a nontrivial twisted sum of  $c_0$  and  $C(2^{\omega_1})$ .*

## Theorem (Marciszewski and Plebanek, JFA–2018)

*Assume  $MA_{\omega_1} \vdash \neg CH$ . Every twisted sum of  $c_0$  and  $C(2^\kappa)$  is trivial, for  $\omega_1 \leq \kappa < \mathfrak{c}$ .*

## Corollary

*It is consistent with ZFC that there is a nonmetrizable compact space  $K$  such that every twisted sum of  $c_0$  and  $C(K)$  is trivial.*

## Open Problem

*Is there in ZFC a nonmetrizable compact space  $K$  such that every twisted sum of  $c_0$  and  $C(K)$  is trivial?*

## Definition

We say that a topological space  $\mathcal{X}$  is scattered if there exists an ordinal  $\alpha$  such that its  $\alpha$ -Cantor-Bendixson derivative  $X^{(\alpha)}$  is empty. If  $\mathcal{X}$  is scattered, then the least ordinal  $\alpha$  such that  $X^{(\alpha)} = \emptyset$  is called the height of  $\mathcal{X}$ . We say that  $\mathcal{X}$  has finite height if its height is a natural number.

## Theorem (Castillo, Top. Appl.–2016)

Assume CH. If  $K$  is a nonmetrizable compact space with finite height, then there exists a nontrivial twisted sum of  $c_0$  and  $C(K)$ .

## Theorem (Marciszewski and Plebanek, JFA–2018)

Assume  $MA+\neg CH$ . If  $K$  is a separable compact space with height 3 and weight smaller than  $\mathfrak{c}$ , then every twisted sum of  $c_0$  and  $C(K)$  is trivial.

### Theorem (Correa and Tausk, Fund. Math.–2018)

*Assume  $MA + \neg CH$ . If  $K$  is a separable compact space with finite height and weight smaller than  $\mathfrak{c}$ , then every twisted sum of  $c_0$  and  $C(K)$  is trivial.*

### Corollary

*The existence of nontrivial twisted sums of  $c_0$  and  $C(K)$ , where  $K$  is a finite height separable compact space, is independent of ZFC.*

### Theorem (Marciszewski and Plebanek, JFA–2018)

*Assume CH. If  $K$  is a nonseparable scattered space, then there exists a nontrivial twisted sum of  $c_0$  and  $C(K)$ .*

### Open Problem

*Does it hold in ZFC that if  $K$  is a nonseparable scattered space, then there exists a nontrivial twisted sum of  $c_0$  and  $C(K)$ ?*

### Proposition (Correa–work in preparation)

*Assume  $MA+\neg CH$ . If  $K$  is a nonseparable scattered space of weight smaller than  $\mathfrak{c}$ , then there exists a nontrivial twisted sum of  $c_0$  and  $C(K)$ .*

## Open Problem

*Assuming  $MA \leftrightarrow CH$ , is there a nontrivial twisted sum of  $c_0$  and  $C(K)$ , for every nonseparable scattered compact space  $K$ ?*

## Conjecture (My personal conjecture)

*If  $K$  is a compact space with weight greater or equal to  $\mathfrak{c}$ , then there exists a nontrivial twisted sum of  $c_0$  and  $C(K)$ .*
